The ability to inexpensively monitor PM2.5 to identify sources and enable controls would advance residential indoor air quality (IAQ) management. Consumer IAQ monitors incorporating low-cost optical particle sensors and connections with smart home platforms could provide this service if they reliably detect PM2 5 in homes. In this study, particles from typical residential sources were generated in a 120 m3 laboratory and time-concentration profiles were measured with 7 consumer monitors (2-3 units each), 2 research monitors (Thermo pDR-1500, MetOne BT-645), a Grimm Mini Wide-Range Aerosol Spectrometer (GRM), and a Tapered Element Oscillating Microbalance with Filter Dynamic Measurement System (FDMS), a Federal Equivalent Method for PM, c. Sources included recreational combustion (candles, cigarettes, incense), cooking activities, an unfiltered ultrasonic humidifier, and dust. FDMS measurements, filter samples, and known densities were used to adjust the GRM to obtain time-resolved mass concentrations. Data from the research monitors and 4 of the consumer monitors-AirBeam, AirVisual, Foobot, Purple Air-were time correlated and within a factor of 2 of the estimated mass concentrations for most sources. All 7 of the consumer and both research monitors substantially under-reported or missed events for which the emitted mass was comprised of particles smaller than 0.3 µm

air pollutant exposure, air quality monitoring, indoor aerosol, PM_{3.5}, ultrafine particles

1 | INTRODUCTION

Fine particulate matter is a substantial health hazard. The U.S. Environmental Protection Agency¹ has determined that both shortand long-term exposures to elevated concentrations of ambient particles smaller than 2.5 µm in diameter, PM, a cause increased cardiovascular morbidity and mortality. EPA also found robust associations to respiratory effects that are likely causal. Much of our exposure to particles of outdoor (ambient) origin occurs in our homes, where we are also exposed to particles generated by indoor activities. Fine particles are emitted from activities such as smoking. cooking, burning incense and candles, secondary aerosol formation. and resuspension of settled dust among other sources. 2-15 Ultrafine

narticles, which are smaller than 100 nm in diameter and thought to present a hazard independent of PM25, are emitted by smoking, candle-burning, and activities related to cooking. 7.11.16.17

Exposure to PM25 from indoor sources can be reduced by limiting particle-producing activities, providing source control ventilation,18 increasing general ventilation, and circulating indoor air through filters. 19-23 Controls may be activated manually if occupants are aware of the emission sources or automatically using information from communicating particle sensors.

Measurement of PM_{2.5} is complicated by variations in composition and size distribution, and by partitioning of organics, water vapor, and ammonium nitrate between condensed and gaseous phases, that can dynamically affect airborne particle concentrations

Accuracy vs Precision

Optical v Gravimetric: Mass Concentration v Particle Count

	Federal Equivalence Methods – FEM's	Federal Reference Methods – FRM's		
	Optical Method	Gravimetric Method		
Particle Count	Direct Measurement	Interpolated Estimation Usually distinguishes only PM10 from PM2.5 based on pre-filtering before particle accumulation		
Mass Concentration	Interpolated Estimation Calculated from particle count number and assumed density of different sized particles	Direct Measurement		

EPA Uses BOTH Methods at their Air Quality Monitoring Stations

Mass Concentration and Particle Size, Count are Needed

Air Quality Index						
AQI Category and Color	Index Value	Description of Air Quality				
Good Green	0 to 50	Air quality is satisfactory, and air pollution poses little or no risk.				
Moderate Yellow	51 to 100	Air quality is acceptable. However, there may be a risk for some people, particularly those who are unusually sensitive to air pollution.				
Unhealthy for Sensitive Groups Orange	101 to 150	Members of sensitive groups may experience health effects. The general public is less likely to be affected.				
Unhealthy Red	151 to 200	Some members of the general public may experience health effects; members of sensitive groups may experience more serious health effects.				
Very Unhealthy Purple	201 to 300	Health alert: The risk of health effects is increased for everyone.				
Hazardous Maroon	301 and higher	Health warning of emergency conditions: everyone is more likely to be affected.				

<u>MC +</u>

Current Sensors vs Piera

Competition

Estimated Concentration PM2.5 only

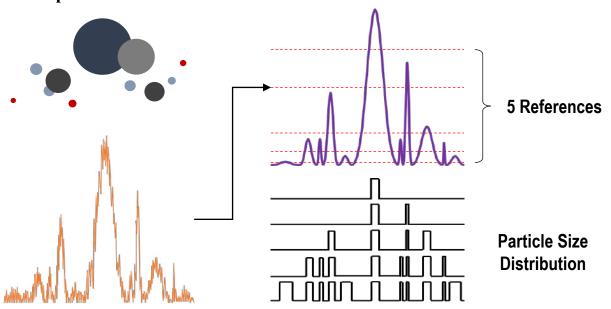

Software—Defined bin sizes count every particle from 0.1-10+um

Piera Sensors correct for Humidity

A particle size distribution—based correction algorithm, founded on κ -Köhler theory, was developed to account for the influence of RH on sensor measurements. The application of the correction algorithm, which assumed physically reasonable κ values, resulted in a significant improvement, with the overestimation of PM measurements reduced from a factor of ~5 before correction to 1.05 after correction.

We conclude that a correction based on particle size distribution, rather than PM mass, is required to properly account for *RH* effects and enable low cost optical PM sensors to provide reliable ambient PM measurements.

We are developing RH correction factos using this approach

Abstract Go to:

There is increasing concern about the health impacts of ambient Particulate Matter (PM) exposure. Traditional monitoring networks, because of their sparseness, cannot provide sufficient spatial-temporal measurements characteristic of ambient PM. Recent studies have shown portable low-cost devices (e.g., optical particle counters, OPCs) can help address this issue; however, their application under ambient conditions can be affected by high relative humidity (RH) conditions. Here, we show how, by exploiting the measured particle size distribution information rather than PM as has been suggested elsewhere, a correction can be derived which not only significantly improves sensor performance but which also retains fundamental information on particle composition. A particle size distribution—based correction algorithm, founded on κ -Köhler theory, was developed to account for the influence of RH on sensor measurements. The application of the correction algorithm, which assumed physically reasonable κ values, resulted in a significant improvement, with the overestimation of PM measurements reduced from a factor of ~5 before correction to 1.05 after correction. We conclude that a correction based on particle size distribution, rather than PM mass, is required to properly account for RH effects and enable low cost optical PM sensors to provide reliable ambient PM measurements.

Air Quality Monitors: A New Wave

The best indoor air-quality monitors: Identify the pollutants that can compromise your health and comfort

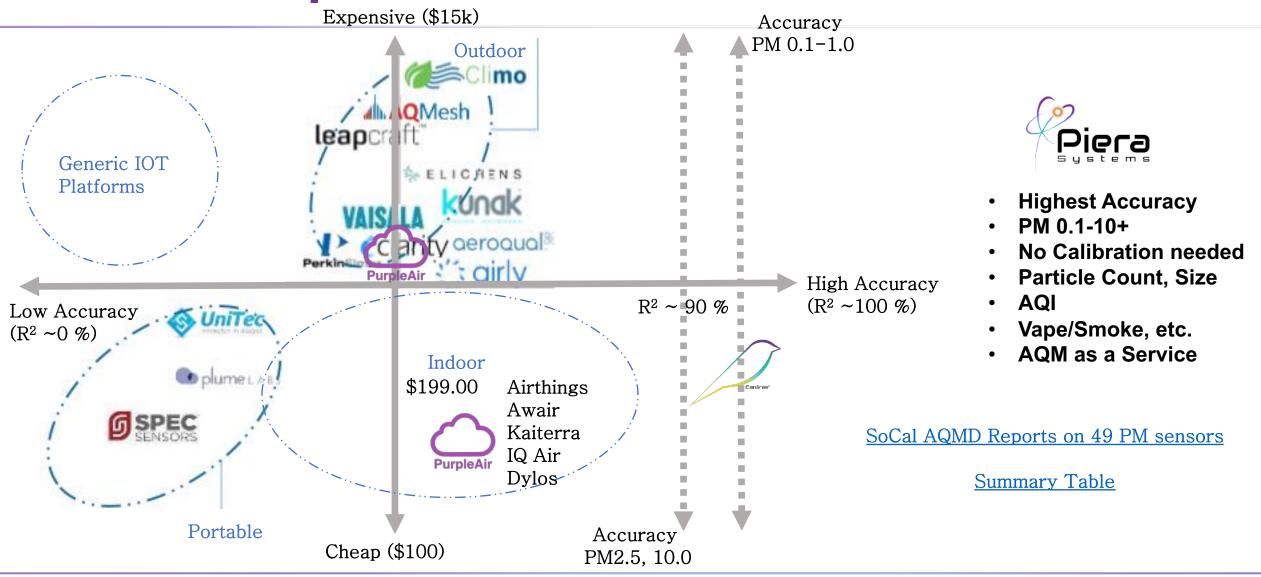

- Existing Consumer, Personal, Commercial Products
 - Utilize inaccurate PM sensors, little differentiation,
 - Calibrated only for PM2.5, estimate PM1.0, 10
- A new Generation of AQMS with Piera sensors are more accurate and can identify sources
- Indoor Use Cases:
 - Smart Spaces (Homes, Office, Commercial, Retail)
 - Industrial, Construction, Recycling, Warehouses
 - Medical Centers (Hospitals, clinics, Dr's offices)
- Outdoor Use Cases
 - Smart Cities, Clean Air Zones
 - Outdoor Activities: sports, retail, dining, shopping
 - Personal Use: biking, hiking, running, walking
 - Regulatory Bodies: EPA, etc.

"We insisted that all of our selections be capable of measuring one specific form of air pollution: particulate matter of 2.5 microns or smaller, better known simply as PM2.5. We favored those that also measured volatile organic compounds, better known as VOCs (in practice, gases and odors). "Source: Wirecutter

PARTNER SOLUTION OVERVIEW

ARUBA & Piera Systems
Indoor Air Quality Monitoring and Reporting

THE NEED FOR INDOOR AIR QUALITY MONITORING

Employees, customers and the general public are now aware of the need to Monitor, Measure and Improve indoor Air Quality, Wildfires, Climate Change, Covid-19 and the increasing amount of time spent indoors has created a 'tipping point' for companies to take action. The source of most poor Air Quality is due to Particulate Matter (PM) a mixture of airborne solid particles and liquid droptets that can be inhaled and causes serious health problems. The World Health Organization (WHO) reports airborne particulate matter (particulate from 0.1-10 micrometer in size) as a Group 1 carcinogen and as the biggest environmental risk to health, with responsibility for about one in every nine deaths annually.

The EPA monitors and reports Outdoor Air Quality but not Indoors and their monitoring stations are quite far apart, expensive and do not update in real-time. The EPA's Air Quality Index (AQI) is a simple, easy to follow metric for classifying Air Quality and can be applied indoors. However, it doesn't classify sources of poor Air Quality. To do so requires more detailed information about particle size and count. A new class of Air Quality Monitors based on more accurate, higher resolution, real-time data about particle size and count has been developed by Piera Systems leveraging existing wireless access points from Aruba to quickly and cost effectively allow monitoring of Indoor Air Quality.

A BREAKTHROUGH IN AIR QUALITY MONITORING: CANÂREE

Canāree™ is a low cost, Air Quality Monitor that when connected to Aruba Access Points operates as an IOT device that measures Air Quality instantly, calculating EPA's AQI and can leverage MS Azure cloud services for secure data storage and remote access to data. Piera's SenseiAQ™ software application running on Azure is a Real-time dashboard that reports AQI together with additional analytics and alerts about indoor Air Quality. Canāree installs by simply plugging into an existing Access Points side USB connector without the need to remove the AP to install. Power and secure lot communications are provided by the AP and Mobility Manager. Data is logged and stored on Azure IoT Hub for easy integration with existing Building Management Systems. Canāree is easy to install, configure, maintain and update and a network of Canāree sensors monitored by SenseiAQ can be easily reconfigured as peneted

WHY ARUBA AND Piera Systems

- Highly accurate Indoor Air quality monitoring & management
- Leverage existing wireless access points to reduce costs, simplify installation and deliver real-time analytics
- SensieAQ™ application provides real-time dashboard, alerts and Insight to take action and improve indoor air quality

aruba

- · Vape/Smoke detection in real-time
- Secure, Cloud-based storage and analytics integrates with existing IT and Facilities Management applications
- Flexible business models allow own/ rent/lease for short or long-term business requirements

Figure 1 Canăree

Canaree utilizes Piera Systems Intelligent Particle Sensor (IPS), an optoelectrical sensor based on laser scattering. IPS utilizes Piera's proprietary Particle Counting Integrated Circuit, (PCLC) a custom ASIC specifically developed for photon-counting and processing (3 granted US patents). PCIC can identify different sized particles and their concentration by directly counting pulses of different levels of photon energy, featuring superior accuracy, resolution and true real-time data acquisition compared to other sensors using a less accurate, slower LPO technique that 'estimates' overall Air Quality.

Canāree's real-time data on PM is stored on Microsoft's Azure IOT hub and SenseiAQ can classify its components and take actions to improve it. Canāree can identify uniquely vape and cigarette smoke using proprietary ML/AI algorithms. Alerts identify it's presence, concentration and persistence (how long it remains in the air). Knowing the source of PM, its location and severity provides insight and mitigation including changing HVAC systems, adding air purifiers, removal of the source or limiting access to areas with poor Air Quality.

- Air Quality Monitoring as a Service
 - Indoors and Outdoors
- Canāree AQMS includes Piera 7100
 - PM: IoT-enabled via USB
 - PRO Stand Alone IOT
- SenseiAQ Software & Dashboard
- Purchase, Lease Models
- Jointly Promoted with HPE/Aruba
- Available Direct, VAR's, White Label

Canāree:

Features

- IOT Device connected to Azure IOT Hub
- USB-A, C, Firewire
- Connects to existing wireless Access Points
- Easy to install, maintain, update
- IPS 7100 sensor with 7 bins
- Ultra-high sensitivity detects PM0.1-PM10
- Fast Response Time: ≤ 0.5 seconds
- Bin sizes PM0.1, 0.3, 0.5, 1.0, 2.5, 5.0 10
- Mass Concentration and Particle Count, Size
- Power Saving mode (<50ma, idle/sleep modes)
- Self-cleaning mode

Applications

- Indoor Air quality monitoring & management
- Smart Spaces, Healthcare Facilities, Industrial
- API to integrate with HVAC, Air purifiers, etc.
- Vape/Smoke detection

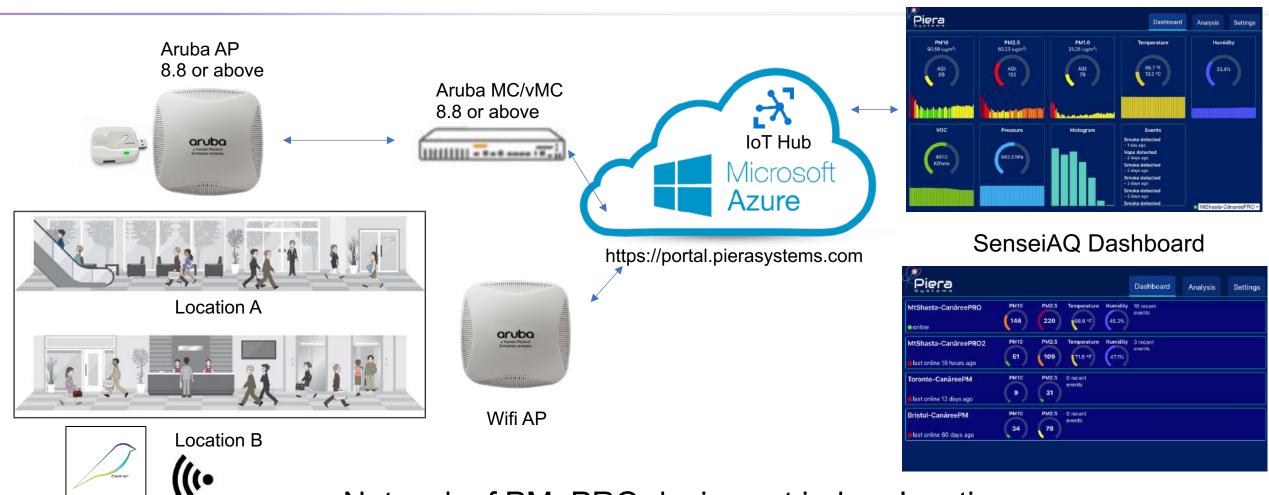

Specifications of Canāree	
Size	7cm x 5cm x 1.4cm (2.75" x 2" x 0.5")
Weight (g)	35 grams (~1.2 ounces)
Power	5 VDC @ 80 ma (0.4 W over USB, continuous)
Coverage	~ 10 m ² , 100 ft ²
# supported sensors	unlimited
Communications Protocol	USB to local device and/or MS Azure
Certifications	CE, KETI
Temp	-10 to + 60 C
Humidity	0 – 95 % RH (non-condensing)
Accuracy	+/- 10 % variance from Reference Instruments
Sampling Time (adjustable)	>0.5 seconds
Onboard LED	AQI, status
Lifetime (24 h/day operation)	8.0 years (may vary due to conditions)

 - Piera Systems

Six Questions to Ask Before You Buy a Lower-Cost Air Sensor Monitor

What is the purpose?

- · Education and information
- Hotspot identification
- Personal exposure
- Citizen Science

tion C

What pollutant or pollutants do I want to measure?

- Particulate matter
- A gas (ozone, nitrogen dioxide)
- Total volatile organic chemicals (VOCs)

What are some of the features I should consider?

- · Size, weight, and portability
- Demonstrated accuracy in the real-world
- Weatherproof
- Power source
- Storage capacity and wireless transmission
- · Maintenance requirements

How can I check the performance of my lower-cost monitor?

- Compare results to a nearby regulatory monitor
- Conduct periodic quality control checks

- Check weather and other conditions that may impact performance
- Periodically review and evaluate data for errors/problems

How much do lower-cost air sensor monitors typically cost?

- \$150-\$1,500 (1-2 pollutants)
- \$500-\$2,500 (1-3 pollutants)
- \$2,500-\$10,000 (4 plus pollutants or one pollutant)

What should I look for in a user manual?

- Type of pollutants measured
- · General operating instructions
- · How to store and recover data
- Conditions of operation
- Expected performance
- Customer service support
